

A cognitive conceptualization provides the framework for understanding a patient.

Situation: A receives low marks in an exam. His friends scored higher marks and discussed their results. He feels upset and stressed after seeing the exam result and stress has continued for several days after the result. He has difficulty concentrating and frequently worrying. This
Reduced interest in studying and interacting with friends.

Past Experiences :parents gave high importance to academic success and often compared the student with high-performing relatives.

Behavior : Avoids talking about exam results. Tries to stay alone and uses mobile phones. A speak less and appears withdrawn. He may exhibit procrastination for studying for the next exam.

The emotions felt by the A are Sadness, anxiety, shame, disappointment.

Automatic Thoughts: the actual words or images that go through a person's mind, are situation specific.

I am a failure and I can never do well in studies.

Core Beliefs: fundamental level of belief, rigid, and overgeneralized.

I am not good enough.

Others judge me based on my performance.

Intermediate Beliefs : Core beliefs influence the development of an intermediate beliefs

- Attitudes : Making mistakes is unacceptable.
- Rules : I should always score high marks.
- Assumptions : If I get low marks, others will think I am not intelligent.

Cognitive distortions: Overgeneralization: I failed once, so I will always fail.
